Wireless Line Level Router System

Graduation programs can be a great source of revenue for your audio rental department. What makes graduations so different is that hundreds of students have the potential of stepping on and possibly damaging or disconnecting cables that may be laid out for delay and remote speakers.

Our new AirLink AR-960 96 channel Wireless Line Level Router solves that big problem in a big way. Now you can feed any mix from your console into the balanced line level input of the AirLink and "broadcast" your mix to locations hundreds of feet away.

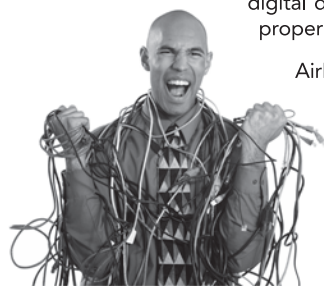

The AirLink sounds GREAT! The audio bandwidth of 50 Hz to 15kHz gives maximum frequency response to your most full range amps and speaker systems. There are no objectionable companding artifacts to compromise dynamic range.

The AirLink is also super easy to use. One input receives a balanced XLR signal and the second input is equipped with dual RCA jacks for unbalanced outputs from CD's, MP3s, etc. Individual level/mute controls let you mix both channels.

The AirLink DR-702D receiver is a diversity type with a balanced XLR output with over 2 volts of output power to drive all your favorite amplifiers! We have also added an optional digital delay module that allows up to 500 milliseconds of delay to properly align delay speakers to main stage area speakers.

AirLink also transmits wireless to our battery powered Titan and Spartan sound systems in the 640-664 mHz range.

*Now that's freedom!*

**AVOID EVIL CABLES**

- ALS-960 transmitter \$409 MSRP
- DR-702 receiver \$339 MSRP
- DR-702D receiver w/ delay \$509 MSRP

THINK BEYOND
